

Is your water at risk?

Shale fracking, the process of extracting gas by using toxic chemicals to crack deep rocks, can turn our water into a dangerous chemical cocktail.

Research in the US has found that 6% of fracking wells leak into ground water in their first year¹. Fracking is starting now in the Mid West and soon there could be thousands of wells across Western Australia.

Once our water is contaminated, it will be forever. The facts are murky about fracking, will your MP keep you safe?

To take action and get all the facts, visit cleanwaterhealthyland.org.au or find us on Facebook.
