Geochemistry (GeoChem Extract)

Geochemistry is an integral part of GSWA mapping and mineralization programs, as well as forming the core of project-specific exercises, such as the 19942001 regional regolith geochemistry program. Geochemistry Online is a multi-element geochemistry database of rocks and regolith, which provides base level information for mineral exploration. The success of these data can be gauged by the significant tenement uptake following release of regional geochemical datasets in the States southwest and the west Arunta region.
